Data Cleaning & Reporting Automation

Introduction

Data cleaning is an important process in data analysis. In this project, employee data was cleaned and organized using Python. Different data cleaning techniques and reporting methods were used to improve the quality of the dataset.

Objective

The main objective of this project is to automate data cleaning and reporting processes using Python.

Tools Used

Python

Pandas

Matplotlib

Jupyter Notebook

Dataset Information

The dataset contains employee details such as employee ID, name, email, job ID, salary, and department ID.

Work Done

Loaded the dataset into Jupyter Notebook

Checked missing values in the dataset

Filled missing values

Removed duplicate records

Converted inconsistent text into a proper format

Generated summary reports

Created charts for data visualization

Result

The dataset was cleaned successfully and automated reports were generated. Visual charts helped in understanding the data more clearly.

Conclusion

This project helped in learning data preprocessing, automation, and reporting techniques using Python.
