Predictive Analytics Using Historical Data

Introduction

Predictive analytics is used to forecast future outcomes using historical data and machine learning techniques.

Objective

The objective of this project is to predict Revenue Growth using historical financial data.

Dataset Description

The dataset contains company financial information such as Quick Ratio, Inventory Ratio, Market share Change, and Revenue Growth.

Data Preprocessing

Missing values were checked and removed. Important numerical features were selected for prediction.

Model Used

Linear Regression model was used to predict Revenue Growth based on historical data.

Model Evaluation

The model was evaluated using Mean Absolute Error (MAE) and R^2 Score.

MAE: 0.05431

R^2 Score: -0.0647

Visualization

A graph was created to compare Actual Revenue Growth and Predicted Revenue Growth.

Conclusion

The project successfully demonstrated predictive analytics workflow including data preprocessing, regression modelling, evaluation, and visualization.
